

Prediction the relationship between ACS and ADR score in a Valorant game

- ACS in Valorant is an abbreviation of "**Average Combat Score.**" Players prefer to call it ACS to communicate more smoothly and fluently. ACS defines a player's overall performance which includes kills, assists, deaths, ability usage, first blood, damage, economic awareness and much more.
- **Average Damage per Round**, or ADR, refers to the average amount of damage points dealt per round across an entire game, series, or event. Each valorant player has 150 points of health, so if you deal 150 points of damage to a player, they die.
